

Omni Ticket

The complete user guide

A Freshdesk-class, omnichannel ticket management system for support teams: every email, chat, social message, portal request and call becomes a trackable ticket with SLAs, cases, handoffs, automations and customer satisfaction — across every Wakanow market.

GOAL — a fully functional replica of Freshdesk (Freshworks): no dead links, no dummy screens.

HOW IT WORKS — one ticket per conversation, threaded automatically across channels.

HONEST STATUS — every feature in this guide is labelled: working, needs credentials, partial, or not built.

Contents

- | | |

| 1 The goal of the app | 2 How it works — the 60-second tour |
| 3 Getting around | 4 Dashboard |
| 5 Tickets — the work queue | 6 The ticket detail screen |
| 7 Closing out a ticket | 8 Cases — one customer, many channels |
| 9 Team handoffs and child tickets | 10 Scenario automations |
| 11 Customer satisfaction (CSAT) | 12 The email channel |
| 13 WhatsApp, SMS, social and voice | 14 Customer portal (Help Center) |
| 15 Contacts and companies | 16 Solutions (knowledge base) and forums |
| 17 Analytics and reports | 18 Admin — the Setup hub |
| 19 Security and governance | 20 Feature status matrix — what works, what needs setup, what is stubbed |

Reading the labels: **WORKING — VERIFIED LIVE** = built, tested and verified in the running product. **WORKS — NEEDS CREDENTIALS** = the software is complete; it activates once you add real account credentials in Settings. **PARTIAL** = usable with a documented limitation. **NOT BUILT YET** = on the backlog; the UI hides it so nothing is a dead link.

1 The goal of the app

Omni Ticket is built to be a **working replica of Freshdesk by Freshworks** for Wakanow's support organisation. The bar it holds itself to: every visible feature is functional (no dead links, no dummy content without a real database seed), every credential is managed inside Settings rather than in code, the interface is polished and mobile-responsive, and support staff can run true omnichannel operations — email, WhatsApp, SMS, Facebook, Instagram, web portal, web chat widget and voice — from one queue.

It is multi-market by design (Nigeria, Ghana, UK, Dubai): every ticket, customer, setting and credential is scoped to a market, and staff only see the markets they are assigned.

2 How it works — the 60-second tour

- **Everything becomes a ticket.** Any inbound communication — an email, a WhatsApp message, a portal request, a webhook from a social provider — automatically opens a ticket (OMNI-####) or threads onto an existing one. Nothing needs to be typed in twice.
- **Threading is automatic.** A reply is matched to its ticket three ways: the email Message-ID chain, a quoted ticket number (e.g. "OMNI-1004") anywhere in the text, or the sender's email address. A customer replying to a resolved ticket automatically **reopens** it.
- **Customers are recognised, not duplicated.** Identity is resolved by email (and phone/handles held as contact points); new contact methods are merged onto the same customer record.
- **A background worker runs every 60 seconds.** It polls the support mailbox, sends queued outbound messages (with retries and a dead-letter state), refreshes SLA timers, auto-closes resolved tickets after 72 hours, rolls up analytics, dispatches alerts and prunes data per retention policy.
- **Agents work one queue.** Filters, views, bulk actions, keyboard shortcuts, canned responses, scenario automations, handoffs and cases keep cross-channel work in one place.

Under the hood: a React single-page app talks to a FastAPI + PostgreSQL backend. Deploys are immutable release snapshots with database migrations, a health gate and automatic rollback.

3 Getting around

WORKING — VERIFIED LIVE

The left sidebar (collapsible on desktop, tab bar on mobile) carries the main screens:

Screen	What it is for
Dashboard	Live omnichannel metrics: trends, performance, CSAT, agents, activity.
Tickets	The work queue — every conversation from every channel.
Omnichat	A Freshchat-style messaging console over the same conversations.
Contacts	Customers and companies (Customer 360).
Solutions	Knowledge base authoring with review/approval workflow.
Workflows	The AI-routed work queue with manual override.
Team Handoffs	Cross-team requests with checklists, due times and linked child tickets.
Analytics	Report library: live catalog, saved views, scheduled exports.
Scheduling dashboard	Field-service appointment board.

Screen	What it is for
Admin	The Setup hub — every configuration tool (Section 18).
Delivery Plan	Internal build tracker for this project (not a support feature).

Global search (magnifier, or press **j/k** in the queue) finds tickets, customers, companies, knowledge articles and agents by name, subject, ticket number, **email address or phone number in any format** (+234 801..., 0801..., digits only).

4 Dashboard

WORKING — VERIFIED LIVE

Where: Sidebar → Dashboard

Every tile is computed live on the server from real tickets, timelines and customer ratings — nothing is hardcoded. Filter by period (today / 7 days / 30 days / all time) and by ticket or chat group; tiles recompute instantly. Clicking Open, Unassigned, Overdue or Due-today drills into the queue with that exact filter applied.

- **Ticket trends:** open, unassigned, overdue, due today.
- **Ticket performance:** average first-response time; resolution-within-SLA % — frozen at the moment each ticket was resolved, so history never drifts.
- **CSAT:** responses with positive/neutral/negative split (tickets) and star average (chat), fed by real customer ratings from the portal (Section 11).
- **Available agents** and a live **recent activity** feed.

Demo/test records (subjects containing the words "test"/"smoke", seeded demo ids, excluded tags) are filtered out of dashboard numbers so the metrics reflect genuine work.

5 Tickets — the work queue

WORKING — VERIFIED LIVE

Where: Sidebar → Tickets

- **Layouts:** card or table. **Views:** all open, my open, unassigned, overdue, resolved today, plus channel views.
- **Filters sidebar:** free search (subject, ticket #, **customer email or phone**), agent, group, created/due windows, status (including Closed), priority, source channel, tags. Active filter count with one-click reset.
- **Bulk bar:** select many tickets, assign an agent or set a status at once. Bulk close-outs run the same guards as the resolve dialog per ticket, then report "n of m closed out".
- **Inline status/assignee dropdowns** on each row — closing statuses route through the close-out guards.

Keyboard shortcuts

Key	Action
w	Watch / unwatch the selected ticket
r	Reply composer
n	Internal note composer
f	Forward / team handoff composer
c	Close without a customer email (guarded quiet resolve)
j / k	Open global search

6 The ticket detail screen

WORKING — VERIFIED LIVE

Where: Tickets → open any ticket

- **Header:** ticket number, channel badges, subject, watch/escalate, and the **Resolve** button (opens the close-out dialog, Section 7).
- **Action bar:** Watch, Reply, Note, Forward, Child task, Close-no-email, Jump — with the active composer mode highlighted and shortcuts shown.
- **Composer** (kept at the top): customer reply, internal note, or team handoff; canned-response macros, translation helper and attachments. Outbound delivery states (queued / sent / failed / retrying) appear on the timeline event.
- **Timeline:** newest first — customer messages, agent replies, notes, status changes, handoffs, AI decisions, connector receipts; Activities / Threads / Linked / Time-log tabs.
- **Properties:** status, priority, assignee, **team + receiving-inbox card** (which team inbox this ticket lands in), SLA promise times, labels, and any custom ticket fields (required fields are enforced before close-out).
- **Potential duplicates:** scored suggestions (same customer +30, matching contact +25, shared booking/transaction reference +42, similar subject/terms/labels) with two one-click actions — **Group as case** or **Merge** (merge closes the source with a full audit trail). Nothing merges automatically.
- **Case card** and **Run scenario** picker (Sections 8 and 10).

7 Closing out a ticket

WORKING — VERIFIED LIVE

Where: Ticket detail → Resolve (or press c for quiet close)

Clicking **Resolve** opens the close-out dialog:

- **Resolved vs Closed** — Resolved means "fixed, awaiting confirmation": the customer replying reopens it, and it auto-closes after 72 idle hours (configurable). Closed is final.
- **Resolution note** — becomes the closing timeline note; included in the customer email when notifying.
- **"Email the customer" toggle** — sends the resolution email (with the CSAT survey invite when a survey covers the channel). "Close no email" genuinely sends nothing.
- **Guards** — required ticket fields must be filled; a parent with open handoff child tickets is blocked (the children are listed) on the screen and again by the server; open cases prompt an "also resolve case" checkbox when this is the last open ticket.

Status	Meaning
New / Open	Untouched / being worked.
Pending / Waiting	Waiting on the customer or a third party.
Resolved	Fixed, awaiting confirmation. Stamps resolved_at and freezes the SLA outcome. Reopens on customer reply; auto-closes after 72h.
Closed	Terminal. Set explicitly, by auto-close, or when a merge closes the source ticket.

Honest metrics: the moment a ticket is resolved, the app stamps the time and whether the SLA was met. Later clock drift, edits or the auto-close can never flip a met ticket to "breached" — and a reopened ticket clears its stamps so a re-resolution records a fresh outcome.

8 Cases — one customer, many channels

WORKING — VERIFIED LIVE

Where: Ticket detail → Case card; duplicates panel → Group as case

A **case** (CASE-####) groups several tickets that belong to the same customer issue arriving on different channels — e.g. a WhatsApp complaint and the follow-up email. Unlike a merge, every ticket keeps its own thread; the case is the umbrella.

- Start a case from any ticket, or add a ticket to one of the customer's existing cases.
- The duplicates panel offers **Group as case** in one click when a related ticket is detected.
- The case card shows status, ticket count, channels and clickable sibling tickets; you can resolve or reopen the whole case from there.
- Resolving a case's last open ticket offers to close out the case in the same action.

9 Team handoffs and child tickets

WORKING — VERIFIED LIVE

Where: Composer → Team handoff; sidebar → Team Handoffs

- A handoff sends work to another team with a reason, checklist and due time. It automatically creates a **child ticket** in the receiving team's queue and emails the team inbox with full case context and attachment links.
- A parent ticket **cannot close while a handoff child is open** — the dialog and the server both refuse, naming the open children.
- Status stays in sync in both directions: resolving the child resolves the handoff (with a note on the parent); marking the handoff resolved closes out its child; cancelling a handoff closes the child so it never strands the parent.
- The Team Handoffs screen tracks every handoff with blockers, checklists and due dates.

10 Scenario automations

WORKING — VERIFIED LIVE

Where: Ticket detail → Run scenario; managed in Admin → Scenario automations

Scenario automations are Freshdesk-style one-click action bundles an agent runs on a ticket — e.g. *Start refund flow*: tag "refund", set priority high, route to Refund Desk, add a checklist note. Pick a scenario in the ticket's properties panel and press Run; every applied action is logged on the timeline and audited. Values are validated before anything is applied (common vocabulary like "resolved"/"medium" is understood), and a scenario that closes a ticket honours the same guards as the resolve dialog.

Separate from scenarios, lightweight automation rules run at ticket creation (auto-tagging, priority and routing heuristics, optional AI work-queue routing). There is no continuous background trigger-rule engine yet — see the status matrix.

11 Customer satisfaction (CSAT)

WORKING — VERIFIED LIVE

Where: Portal → track ticket → rate; configured in Admin → CSAT surveys

- When a ticket is resolved with notification, the email includes the active survey's question and invites the customer to rate the experience in the Help Center.

- On the portal, a resolved ticket shows a **1–5 star rating with an optional comment** — verified by the same email + ticket number pair as portal replies, rate-limited, no login needed. Ratings can be updated.
- Ratings flow straight into the dashboard CSAT tiles and analytics as real customer data. Agent-recorded feedback stays internal and is never shown on the portal.
- Surveys are configured per market and per channel in Admin (question, scale, active).

12 The email channel

WORKS — NEEDS CREDENTIALS

Where: Admin → Setup → Email; team addresses in People → Groups

Email is fully built end-to-end and activates the moment you connect a mailbox — no code, no DNS changes. Nothing "pushes" mail into the app: the background worker polls your existing mailbox over IMAP roughly every 60 seconds and sends outbound through your SMTP server.

- **Inbound:** unseen emails become tickets; replies thread by Message-ID, quoted OMNI-#### or sender; a reply to a resolved ticket reopens it; every new ticket triggers a configurable acknowledgement email.
- **Outbound:** agent replies, resolution emails (with survey invite), acknowledgements and SLA-breach alerts to the owning team's inbox — all through a queue with retries, dead-lettering and per-message delivery states visible on the timeline and in the outbound monitor.
- **Team inboxes:** each team (People → Groups) can carry its own address (billing-support@...); the Email setup screen shows the full team-inbox table, and each ticket shows its receiving inbox.
- **Setup:** enter IMAP host/port/user/password and SMTP host/port/user/password + from-address per market. Readiness lights flip to "IMAP live" / "SMTP live"; secrets are write-only.

Provider notes: Gmail/Google Workspace needs an App Password (imap.gmail.com:993 / smtp.gmail.com:587). Generic IMAP hosts (Zoho, cPanel) work with plain credentials. **Microsoft 365 inbound will not connect yet** — M365 requires OAuth2 for IMAP, which is on the backlog (see status matrix).

13 WhatsApp, SMS, social and voice

WORKS — NEEDS CREDENTIALS

Where: Admin → Provider credentials / Connector control center

- **WhatsApp, SMS, Facebook, Instagram:** signed webhooks receive provider events (signature-verified, de-duplicated, rate-limited) and open or thread tickets exactly like email. Outbound replies go through the same monitored queue. Each connector account has intake/outbound toggles, a webhook URL, credential references and failure counters — it goes live once the provider's credentials and webhook secret are entered in Settings.
- **Web chat widget:** appearance, welcome copy and routing are configured per market in Admin → Widgets; conversations arrive through the connector pipeline.
- **Omnichat console:** a Freshchat-style team inbox (dashboard, campaigns, people, reports views) over the same conversations — useful for chat-first workflows.
- **Voice:** call events arrive via the voice webhook and are logged as call receipts on tickets. **Partial:** there is no in-app dialer or call audio — telephony stays in your phone system.

14 Customer portal (Help Center)

WORKING — VERIFIED LIVE

Where: Public URL: the app with ?screen=portal — no login required

- **Search answers:** published knowledge articles with suggestions as the customer types.
- **Open a request:** name, email, phone, subject, description plus any custom fields you configured; the customer gets the ticket number and an acknowledgement email.
- **Track a request:** ticket number + email shows a customer-safe status, the public conversation, and article suggestions; the customer can **reply** and **attach files** (scanned, size-limited).
- **Rate the experience:** 1–5 stars + comment once resolved (Section 11).
- **Branding:** logo, colours, support name and welcome message per market (Admin → Portal branding).
- All portal endpoints are rate-limited and expose only customer-safe fields.

15 Contacts and companies

WORKING — VERIFIED LIVE

Where: Sidebar → Contacts

- Customer 360: contact methods across channels (email, phone, WhatsApp, social handles), company, tags, sentiment, health score, open value and the full conversation history.
- Search by name, email, **phone (any format)**, company or tag.
- Companies carry tier, health and account value; customers created from the portal or connectors are de-duplicated by email and enriched with new contact points automatically.

16 Solutions (knowledge base) and forums

WORKING — VERIFIED LIVE

Where: Sidebar → Solutions; forums in Admin → Forums

- Articles follow a draft → review → approved/published workflow with per-state timestamps and approvers; published articles surface in the portal and as suggestions on tickets and portal requests.
- Ticket detail shows ranked knowledge suggestions for the current issue.
- Community forums: topics and threaded comments with moderation, seeded per market.

17 Analytics and reports

WORKING — VERIFIED LIVE

Where: Sidebar → Analytics

- Report library with a live catalog (omnichannel dashboard, chat analytics, team performance, customer satisfaction, AI-agent analytics), saved leadership views and scheduled exports.
- Hourly analytics rollups are persisted by the worker for trend history.
- Audit log exports to CSV/JSON with filters (actor, action, entity, time window) and retention preview.

18 Admin — the Setup hub

WORKING — VERIFIED LIVE

Where: Sidebar → Admin

Setup opens as a landing grid of every configuration tool, grouped by area; clicking a tool focuses just that panel with an "All tools" back button — the Freshdesk admin model. Every tile below is clickable and functional; credentials are always entered here, never in code.

Area	Tools
People	Agents, Groups (incl. team email), Roles, Business hours, Profile settings, MFA, Enterprise SSO, Permission profiles, Market access, API status, Security controls
Ticket forms	Ticket fields (required-on-resolve), Ticket forms, Contact fields, Company fields, Custom objects, Multiple products, Portal branding, Helpdesk settings
Governance	Audit export, Retention, Attachment lifecycle, Operational alerts, Scheduled exports, Forums, Field service scheduling
Connectors	Email (IMAP/SMTP + Team inboxes), Widgets, Phone, WhatsApp, Facebook, Omnicat, Feedback form, Provider credentials, Marketplace apps, Account exports, Production account pack
Automation	SLA policies, Automations, Email notifications (ack / resolved / SLA-breach), CSAT surveys, Proactive outreach, Canned responses, Ticket templates, Scenario automations, Canned forms, Tags, Threads

The **Production account pack** generates a ready-to-send request (email draft + checklist) for every external account/credential still needed to go fully live — a genuine go-live runbook.

19 Security and governance

WORKING — VERIFIED LIVE

- Roles (admin / supervisor / agent / auditor) with permission profiles and per-user overrides; market-scoped access everywhere.
- MFA enrolment and verification; Enterprise SSO via OIDC (configure your identity provider in Settings — needs your IdP details to activate).
- Full audit trail (logins, ticket changes, merges, scenario runs, worker actions) with retention policies and export.
- Webhooks are signature-verified with replay tolerance; public portal routes are rate-limited; secrets are write-only (the API only ever reports "configured: yes/no"); optimistic-concurrency ETags prevent stale overwrites.

20 Feature status matrix

The honest inventory. "Verified live" means exercised in the running product, not just unit-tested.

Working — verified live

Feature	Notes
Dashboard analytics + drill-downs	Server-computed, filterable, honest metrics.
Ticket queue, detail, composer, shortcuts, bulk	Full omnichannel work surface.
Close-out suite	Resolve dialog, Resolved vs Closed, resolution email + note, guards, auto-close 72h, reopen-on-reply, frozen SLA outcome.
Cases (cross-channel grouping)	Create / attach / siblings / resolve, last-ticket prompt, triage 'Group as case'.
Duplicates + merge	Scored suggestions; merge with audit trail; never automatic.
Handoffs + child tickets	Auto child ticket + team email, close guard, two-way status sync, cancel closes child.
Scenario automations	Validated one-click bundles with timeline + audit.
CSAT loop	Survey invite → portal star rating → dashboard. Real customer data.
Email notifications	Acknowledgement, resolution and SLA-breach emails — config-gated in Setup.
Customer portal	Search, submit, track, reply, attachments, rating, branding.
Search by email/phone	Global + queue + contacts, any phone format.
Knowledge base + forums	Authoring workflow, portal surfacing, suggestions, moderation.
Setup hub (all 48 tools)	Focused-hub admin; credentials centralized; no dead tiles.
Security & governance	Roles, MFA, audit + retention, rate limits, signed webhooks.

Works — needs credentials to go live

Feature	What to add (all in Settings)
Email intake + outbound	IMAP + SMTP credentials per market (Setup → Email). Gmail: app password.
WhatsApp / SMS / Facebook / Instagram	Provider credentials + webhook secret per connector (Provider credentials).
Web chat widget	Enable + embed for your site (Setup → Widgets).
Enterprise SSO (OIDC)	Identity-provider client ID/secret + endpoints (People → Enterprise SSO).
Operational alert delivery	Webhook destination for critical alerts (Governance → Operational alerts).

Partial or stubbed — the honest list

Item	Status	Detail
Voice/telephony	PARTIAL	Call events log as receipts on tickets; no in-app dialer or audio.
AI assist (copilot, AI work queue)	PARTIAL	Rule-based heuristics, not a large-language-model: summaries, suggested replies, routing and priority come from deterministic rules. Useful, but not generative AI.

Item	Status	Detail
Automation rules engine	PARTIAL	Rules apply at ticket creation (tagging/routing). No continuous time/event trigger engine (e.g. 'if waiting 36h then...') beyond SLA + auto-close workers.
Time logs	PARTIAL	Manual minute entries stored in the browser only; not on the server, no running timer.
Microsoft 365 email intake	NOT BUILT YET	M365 requires OAuth2 (XOAUTH2) for IMAP; the current adapter is password-auth. Works: Gmail app-password, Zoho, cPanel/generic.
Advanced ticketing / Purchase history tiles	NOT BUILT YET	Hidden in Setup so they are not dead links; not built.
Demo seed data	PARTIAL	Fresh installs seed a small realistic dataset (6 tickets, demo case, surveys) so screens are never empty; production data accumulates alongside and dashboards exclude test-marked records.
Delivery Plan screen	PARTIAL	Internal engineering tracker for this build, not a support feature.

Version: production release Claude-20260707012442 at omni.wakanow.com · database migration 0042 · guide generated 07 Jul 2026. The living backlog (BACKLOG.md in the repository) tracks every item above with commit references.
